CAVE-IN-ROCK SWITCHGRASS

Switchgrass is a warm season native bunch grass endemic to practically all of North America. As a warm season grass, it flourishes in warmer months of the year (from about June until September or October) and goes dormant during the winter months. At full maturity, switchgrass can reach a height between 5 and 6 feet tall and, while it is technically a bunch grass, it also spreads by seed drop and underground rhizomes. Purchased by the pound.

SEEDING RATE:

Sow 6-10 lbs. per acre

HALL, NY (585) 526-6391

MIFFLINBURG, PA (570) 966-3841
